

## Introduction

The LogiCORE™ IP RXAUI core is a high-performance, low pin count 10 Gb/s interface intended to allow physical separation between the data-link layer and physical layer devices in a 10 Gigabit Ethernet system.

The RXAUI core implements a single-speed full-duplex 10 Gb/s Ethernet Reduced Pin eXtended Attachment Unit Interface (RXAUI) solution for Xilinx® 7 series and Virtex®-6 FPGAs that comply with the Dune Networks and Marvell RXAUI specifications.

Virtex-7, Kintex™-7 and Virtex-6 FPGAs in combination with the RXAUI core, enable the design of RXAUI-based interconnects whether they are chip-to-chip, over backplanes, or connected to 10 Gigabit optical modules.

## Features

- Designed to Dune Networks and Marvell RXAUI specifications
- Uses transceivers at 6.25 Gb/s line rate to achieve 10 Gb/s data rate
- Implements DTE XGXS, PHY XGXS, and 10GBASE-X PCS in a single netlist
- Uses Mixed-Mode Clock Managers
- Uses device-specific transceivers for the RXAUI interface
- IEEE 802.3-2008 clause 45 MDIO interface (optional)
- Available under the [Xilinx End User License Agreement](#)

## Overview

The RXAUI standard was developed as a means to improve the 10 Gigabit Ethernet port density. The number of XAUI interfaces that could be implemented was limited by the number of available transceivers, with capacity and performance still to be utilized. RXAUI halves the number of transceivers required compared with a XAUI implementation.

RXAUI is a two-lane, 6.25 Gb/s-per-lane serial interface. It is intended to work with an existing XAUI implementation and multiplexes/demultiplexes the two physical RXAUI lanes into 4 logical XAUI lanes. Each RXAUI lane is a differential pair carrying current mode logic (CML) signaling, and the data on each lane is 8B/10B encoded before transmission. The Dune Networks RXAUI implementation maintains 8B/10B disparity per RXAUI physical lane and the Marvell RXAUI implementation maintains 8B/10B disparity per XAUI logical lane. Special code groups are used to allow each lane to synchronize at a word boundary and to de-mux the two physical RXAUI lanes into four logical XAUI lanes at the receiving end. For full details on the RXAUI specification, contact Dune Networks or Marvell.

## Applications

The applications of RXAUI have extended beyond 10 Gigabit Ethernet to backplane and other general high-speed interconnect applications. [Figure 1](#) shows a typical backplane application.

Figure 1: Typical Backplane Application for RXAUI

## Functional Description

Figure 2 shows a block diagram of the Dune Networks RXAUI core implementation. The major functional blocks of the core include the following:

- **Transmit Idle Generation Logic** creates the code groups to allow synchronization and alignment at the receiver.
- **Demux Logic** separates the two physical RXAUI lanes into four logical XAUI lanes.
- **Synchronization State Machine (one per lane)** identifies byte boundaries in incoming serial data.
- **Deskew State Machine** monitors the deskew logic per the IEEE 802.3-2008 specification.
- **Optional MDIO Interface** is a two-wire low-speed serial interface used to manage the core.
- **Transceiver** (integrated in the FPGA) provides the high-speed transceivers as well as 8B/10B encode and decode, and elastic buffering in the receive datapath.

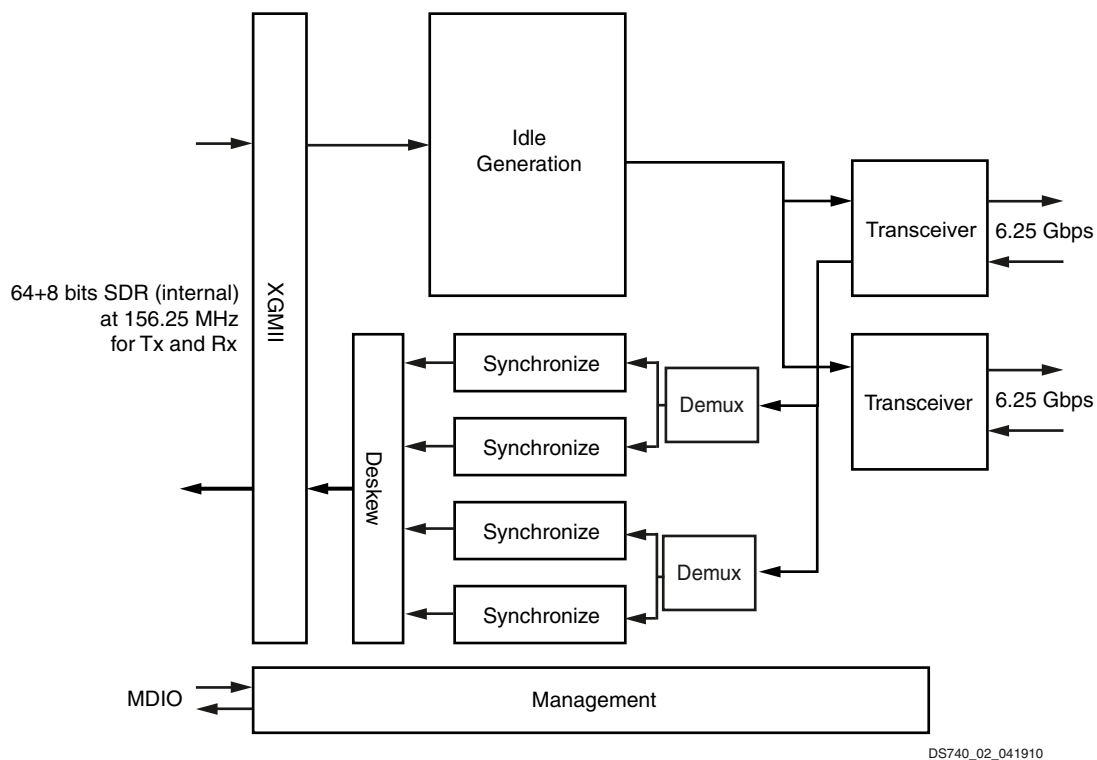

Figure 2: Implementation of Dune Networks RXAUI Core

Figure 3 shows a block diagram of the Marvell RXAUI core implementation. The major functional blocks of the core include the ones previously described in the Dune Networks implementation, and the following:

**8B/10B encoder / decoder:** Performs 8B/10B data conversion

**Deskew:** deskews the four received lanes into alignment

**Clock Correction:** Elastic buffer and clock correction manipulation to handle difference in clock rates

The core is implemented with the transceiver instantiations in the source code rather than in the netlist. This gives the user more flexibility in their particular application to use additional device-specific transceiver features and resolve placement issues.

## Core Interfaces

### RXAUI Interface

The RXAUI interface consists of two differential transmit and receive pairs plus two low-speed control inputs to indicate the status of an attached optical module. The differential pairs are generated by the transceiver. The control input signals are connected directly to the core. These signals are described in Table 1.

Table 1: RXAUI Interface Ports

Signal Name	Direction	Description
SIGNAL_DETECT[1:0]	IN	Signals from an optical module indicating the optical receivers are illuminated by a signal. If unused, tie this bus to 11.

## Client-Side Interface

The client-side interface is a 72-bit (64 data bits and 8 control bits) interface running at 156.25 MHz based on the XGMII standard. It is designed to be connected to user logic within the FPGA.

Table 2: Client-Side Interface Ports

Name	Direction	Description
XGMII_TXD[63:0]	IN	Transmit data, 8 bytes wide
XGMII_TXC[7:0]	IN	Transmit control bits, one bit per transmit data byte.
XGMII_RXD[63:0]	OUT	Received data, 8 bytes wide
XGMII_RXC[7:0]	OUT	Receive control bits, one bit per received data byte.

Figure 4 illustrates transmitting a frame through the client-side interface.

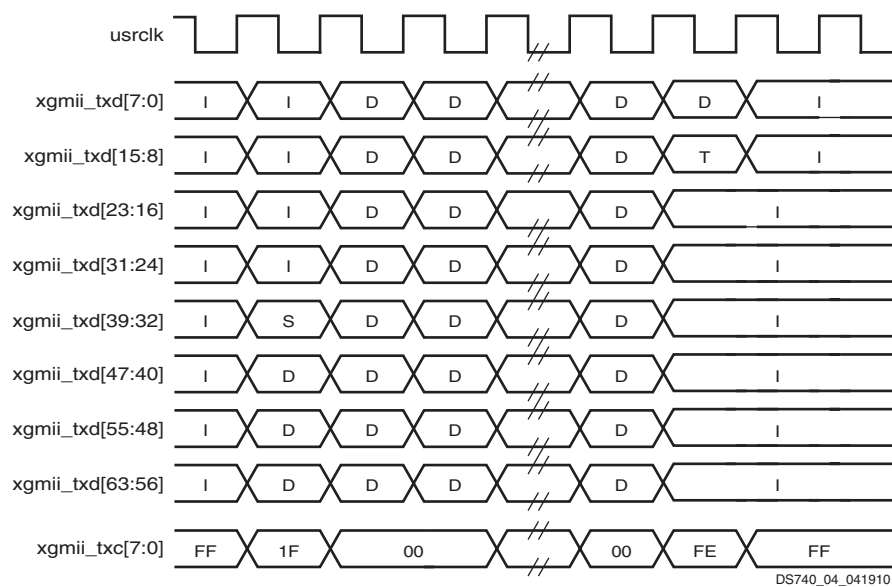

Figure 4: Transmitting a Frame Through the Client-Side Interface

Figure 5 illustrates receiving a frame through the client-side interface.

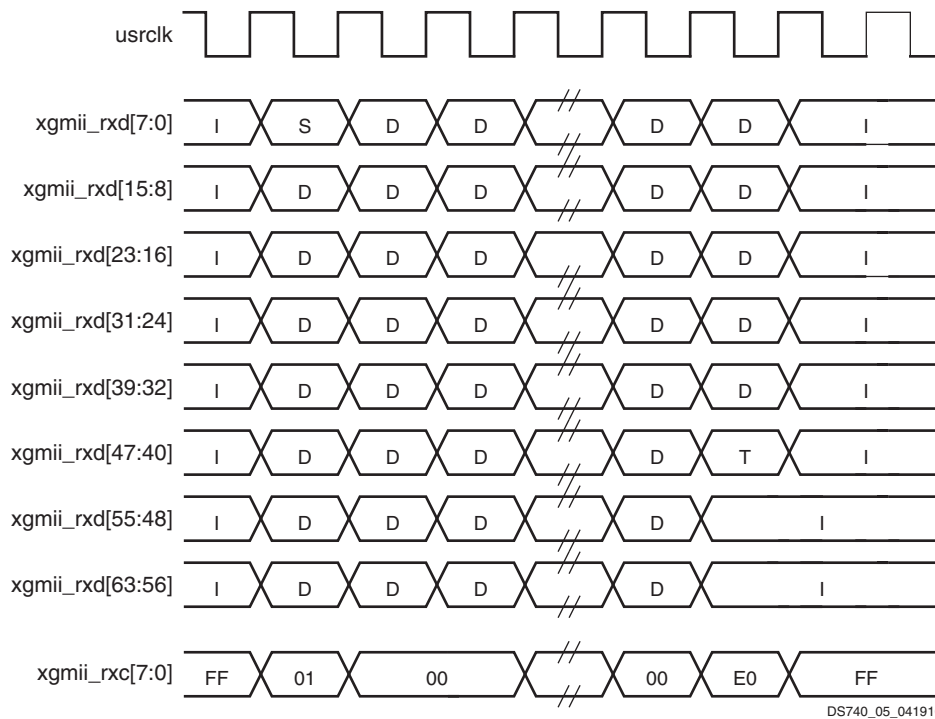

Figure 5: Receiving a Frame Through the Client-Side Interface

## Management Interface (MDIO)

The MDIO interface is a simple low-speed 2-wire interface for management of the RXAUI core, consisting of a clock signal and a bidirectional data signal. The interface is defined in clause 45 of *IEEE 802.3-2008* standard.

In the RXAUI core, the MDIO interface is an optional block. If implemented, the bidirectional data signal MDIO is implemented as three unidirectional signals. These can be used to drive a 3-state buffer either in the FPGA IOB or in a separate device. There are additional signals that control the behavior of the core MDIO interface, specifically to set its position in the MDIO memory map.

Table 3: MDIO Management Interface Ports

Signal Name	Direction	Description
MDC	IN	Management clock
MDIO_IN	IN	MDIO input
MDIO_OUT	OUT	MDIO output
MDIO_TRI	OUT	MDIO 3-state. 1 disconnects the output driver from the MDIO bus.
TYPE_SEL[1:0]	IN	Type select. Determines which MDIO Register addresses the core responds to. type_sel = 00 or 01 – 10GBASE-X PCS type_sel = 10 – DTE XS type_sel = 11 – PHY XS See the <i>RXAUI User Guide</i> [Ref 4] for the MDIO Register addresses responded to in each case.
PRTAD[4:0]	IN	MDIO port address. When multiple MDIO-managed ports appear on the same bus, this address can be used to address each one individually.

## Configuration and Status Signals

In addition to the pollable MDIO interface, the RXAUI core continuously indicates its status on ports as defined in [Table 4](#).

**Table 4: Configuration and Status Vector Ports**

Signal Name	Direction	Description
ALIGN_STATUS	OUT	1 when the RXAUI receiver is aligned across four logical XAUI lanes.
SYNC_STATUS[3:0]	OUT	Each pin is 1 when the respective XAUI logical lane receiver is synchronized to byte boundaries.
CONFIGURATION_VECTOR[6:0]	IN	<p>Configuration signals for the core. The bits are:</p> <ul style="list-style-type: none"> <li>Bit 0 - Loopback</li> <li>Bit 1 - Power down transceiver</li> <li>Bit 2 - Reset local fault status</li> <li>Bit 3 - Reset RX link status</li> <li>Bit 4 - Test Enable - 1 transmits test patterns on RXAUI TX</li> <li>Bits 6:5 - Test pattern select</li> </ul> <p>For a more comprehensive description of these signals, consult the <i>RXAUI User Guide</i> <a href="#">[Ref 4]</a>.</p> <p>This port only exists on the core if the MDIO interface is omitted.</p>
STATUS_VECTOR[7:0]	OUT	<p>Status indicators for the core. The bits are:</p> <ul style="list-style-type: none"> <li>Bit 0 - TX local fault</li> <li>Bit 1 - RX local fault</li> <li>Bit 5:2 - Synchronization - identical to SYNC_STATUS[3:0]</li> <li>Bit 6 - Alignment - identical to ALIGN_STATUS</li> <li>Bit 7 - RX link status</li> </ul> <p>For a more comprehensive description of these signals, consult the <i>RXAUI User Guide</i> <a href="#">[Ref 4]</a>.</p> <p>This port only exists on the core if the MDIO interface is omitted.</p>

## Clock and Reset

[Table 5](#) describes the clock and reset ports present on the core.

**Table 5: Clock and Reset Ports**

Name	Direction	Description
RESET	IN	Synchronous reset for core. The reference clock must be running for the core to emerge from the reset state.
USRCLK	IN	FPGA logic system clock.
MGT_TX_RESET	IN	Connect this to the same signal used to drive the serial transceiver TXRESET signal.
MGT_RX_RESET	IN	Connect this to the same signal used to drive the serial transceiver RXRESET signal.
RXCLK	IN	Transceiver recovered clock (Present only in Marvell Mode).

## MDIO Management Registers

The RXAUI core, when generated with an MDIO interface, implements an MDIO Interface Register block. The core responds to MDIO transactions as either a 10GBASE-X PCS, a DTE XS, or a PHY XS depending on the setting of the `type_sel` port (see [Table 3](#)).

### 10GBASE-X PCS Registers

[Table 6](#) shows the MDIO registers present when the RXAUI core is configured as a 10GBASE-X PCS. For a more comprehensive description of the registers and their effect on core operation, see the *RXAUI User Guide* [[Ref 4](#)].

**Table 6: 10GBASE-X PCS/PMA MDIO Registers**

Register Address	Register Name
1.0	PMA/PMD Control 1
1.1	PMA/PMD Status 1
1.2,1.3	PMA/PMD Device Identifier
1.4	PMA/PMD Speed Ability
1.5, 1.6	PMA/PMD Devices in Package
1.7	10G PMA/PMD Control 2
1.8	10G PMA/PMD Status 2
1.9	Reserved
1.10	10G PMD Receive Signal OK
1.11 TO 1.13	Reserved
1.14, 1.15	PMA/PMD Package Identifier
1.16 to 1.65 535	Reserved
3.0	PCS Control 1
3.1	PCS Status 1
3.2, 3.3	PCS Device Identifier
3.4	PCS Speed Ability
3.5, 3.6	PCS Devices in Package
3.7	10G PCS Control 2
3.8	10G PCS Status 2
3.9 to 3.13	Reserved
3.14, 3.15	PCS Package Identifier
3.16 to 3.23	Reserved
3.24	10GBASE-X PCS Status
3.25	10GBASE-X Test Control
3.26 to 3.65 535	Reserved

## DTE XS Registers

Table 7 shows the MDIO registers present when the RXAUI core is configured as a DTE XS. For a more comprehensive description of the registers and their effect on core operation, see the *RXAUI User Guide* [Ref 4].

Table 7: DTE XS MDIO Registers

Register Address	Register Name
5.0	DTE XS Control 1
5.1	DTE XS Status 1
5.2, 5.3	DTE XS Device Identifier
5.4	DTE XS Speed Ability
5.5, 5.6	DTE XS Devices in Package
5.7	Reserved
5.8	DTE XS Status 2
5.9 to 5.13	Reserved
5.14, 5.15	DTE XS Package Identifier
5.16 to 5.23	Reserved
5.24	10G DTE XGXS Lane Status
5.25	10G DTE XGXS Test Control

## PHY XS Registers

Table 8 shows the MDIO registers present when the RXAUI core is configured as a PHY XS. For a more comprehensive description of the registers and their effect on core operation, see the *RXAUI User Guide* [Ref 4].

Table 8: PHY XS MDIO Registers

Register Address	Register Name
4.0	PHY XS Control 1
4.1	PHY XS Status 1
4.2, 4.3	PHY XS Device Identifier
4.4	PHY XS Speed Ability
4.5, 4.6	PHY XS Devices in Package
4.7	Reserved
4.8	PHY XS Status 2
4.9 to 4.13	Reserved
4.14, 4.15	PHY XS Package Identifier
4.16 to 4.23	Reserved
4.24	10G PHY XGXS Lane Status
4.25	10G PHY XGXS Test Control

## Verification

The RXAUI core has been verified using both simulation and hardware testing.

## Simulation

A highly parameterizable transaction-based simulation test suite was used to verify the core. Verification tests include:

- Register access over MDIO
- Loss and regain of synchronization
- Loss and regain of alignment
- Frame transmission
- Frame reception
- Clock compensation
- Recovery from error conditions

## Hardware Verification

The core has been tested on the ML623 Virtex-6 LXT test family. The design comprises the Xilinx 10 Gb/s MAC, RXAUI, a *ping* loopback FIFO, and a test pattern generator all under embedded processor control. This design was used for conformance and inter operability testing with Dune Networks devices.

## Device Utilization

Table 9 provides approximate utilization for the various core options on Virtex-6 LXT FPGAs.

Table 9: Device Utilization – Virtex-6 LXT FPGAs

MDIO Management	RXAUI Mode	Slices	LUTs	FFs	BUFRs
FALSE	Dune	360	672	832	0
TRUE	Dune	432	818	927	0
FALSE	Dune-Alternate	393	738	832	0
TRUE	Dune-Alternate	457	876	927	0
FALSE	Marvell	669	1306	1435	1
TRUE	Marvell	739	1453	1530	1

Table 10 provides approximate utilization for the various core options on Virtex-7 and Kintex-7 FPGAs.

Table 10: Device Utilization – Virtex-7 and Kintex-7 FPGAs

MDIO Management	RXAUI Mode	LUTs	FFs
FALSE	Dune	631	780
TRUE	Dune	775	875
FALSE	Dune_Alternate	680	780
TRUE	Dune_Alternate	830	875
FALSE	Marvell	1364	1294
TRUE	Marvell	1506	1389

## Support

Visit [www.xilinx.com/support](http://www.xilinx.com/support) for technical support. Xilinx provides technical support for this LogiCORE IP product when used as described in product documentation.

Xilinx cannot guarantee timing, functionality, or support of product if implemented in devices that are not listed in the documentation or if customized beyond that allowed in the product documentation, or if any changes are made in sections of the design marked *DO NOT MODIFY*.

## Ordering Information

This version of the RXAUI IP core does not require a license key. Previous versions of the RXAUI IP core released in ISE® v12.1 and earlier did require a license key; see the documentation for the version of the core you are using for information.

## Revision History

Date	Version	Revision
9/16/09	1.1	Initial Xilinx release
4/19/10	1.2	Updated to v1.2 for 12.1 release; added Marvell RXAUI Specification support.
3/01/11	1.3	Updated to v1.3 for 13.1 release.
4/24/12	1.4	Update to v2.3 for 14.1 release. Added support for Virtex-7 GTH transceivers.
